

## HC3: Sector Alert December 16, 2022 TLP:CLEAR Report: 202212161700

## **Citrix ADC and Gateway Vulnerabilities**

#### **Executive Summary**

Citrix released patches for a vulnerability that impacts both their Application Delivery Controller and Gateway platforms. This vulnerability allows a remote attacker to completely compromise a target system. These vulnerabilities are known to be actively exploited by a highly capable state-sponsored adversary. Furthermore, the Department of Health and Human Services is aware of U.S. healthcare entities that have already been compromised by the exploitation of this vulnerability. HC3 strongly urges all healthcare and public health organizations to review their inventory for these systems and prioritize the implementation of these patches.

#### Report

Citrix has recently <u>patched what they describe as a "critical" zero-day vulnerability in their Application</u> <u>Delivery Controller and Gateway</u>. This vulnerability, which is actively compromised, allows an unauthenticated attacker to potentially execute commands remotely on vulnerable devices and completely compromise a system. This report contains the steps necessary to completely protect a system from potential compromise.

#### Report

These vulnerabilities are known to be actively <u>exploited by a Chinese state-sponsored advanced persistent</u> <u>threat known as APT5</u>, and also UNC2630 and MANGANESE. Separately, the US Department of Health and Human Services is aware of U.S. healthcare organizations that have already been compromised by the exploitation of the vulnerability described in this report, although in each case the specific attacker has not yet been identified.

#### **Vulnerability**

This vulnerability is tracked as <u>CVE-2022-27518</u> and impacts the following versions of Citrix ADC and Citrix Gateway:

- Citrix ADC and Citrix Gateway 13.0 before 13.0-58.32
- Citrix ADC and Citrix Gateway 12.1 before 12.1-65.25
- Citrix ADC 12.1-FIPS before 12.1-55.291
- Citrix ADC 12.1-NDcPP before 12.1-55.291 nec lorem

Furthermore, any of the affected versions of the two platforms must be configured as a SAML (Security Assertion Markup Language) service provider or identity provider. As per <u>Citrix guidance</u>, customers can determine if their Citrix ADC or Citrix Gateway is configured as a SAML SP or a SAML IdP by inspecting the "ns.conf" file for the following commands:

- "add authentication samlAction"
- "add authentication samlldPProfile"

Either one of these commands being present in the "ns.conf" file (on an instance of one of the affected platform versions listed above) is an indication that the system in question is vulnerable.

# HC3: Sector Alert December 16, 2022 TLP:CLEAR Report: 202212161700

#### **Patches, Mitigations, and Workarounds**

The most optimal solution is to upgrade all vulnerable instances of these Citrix platforms. For any organization running YARA, there are <u>signatures available</u>.

Upon detection of compromise of these vulnerabilities, the following actions are <u>recommended by the</u> <u>National Security Agency</u>:

- Move all Citrix ADC instances behind a VPN or other capability that requires valid user authentication (ideally multi-factor) prior to being able to access the ADC.
- Isolate the Citrix ADC appliances from the environment to ensure any malicious activity is contained.
- Restore the Citrix ADC to a known good state
